Advanced Data Download

software

FREE DATA DOWNLOAD

FROM ALL THE MARKETS OF THE WORLD

INFORMATION

ADD is a software created for the management of the data of the most important markets in the world. Discharge free of charge such data using like a primary source yahoo.

For every title it they are available relative information concerning to:

- Open price,
- Close price,
- Maximum caught up in the day,
- Minimal touched in the day
- Volumes of exchanges .

The prices are in euro and the timeframe is daily.

It is possible:

- to manage charts,
- to convert the data in more used forms,
- to elaborate the data,
- to insert alarms and be informed of them via email.
- to follow the economic course of the own investments through the concerning with economic management.

DISCLAIMER

No guarantee in implicit or explicit shape is supplied about the sufficiency of the information given from the program. The customer therefore will have to charge of makes with all responsibilities and risks deriving from the use to the program. The data are downloaded from external sources which are independent from our control, therefore isn't guaranteed their complete reliability. Wrong data or other discrepancies, can't be attributed to software, since it doesn't manager of data do not deal , but only compute of the same ones from Internet sources.

SYSTEM REQUIREMENT

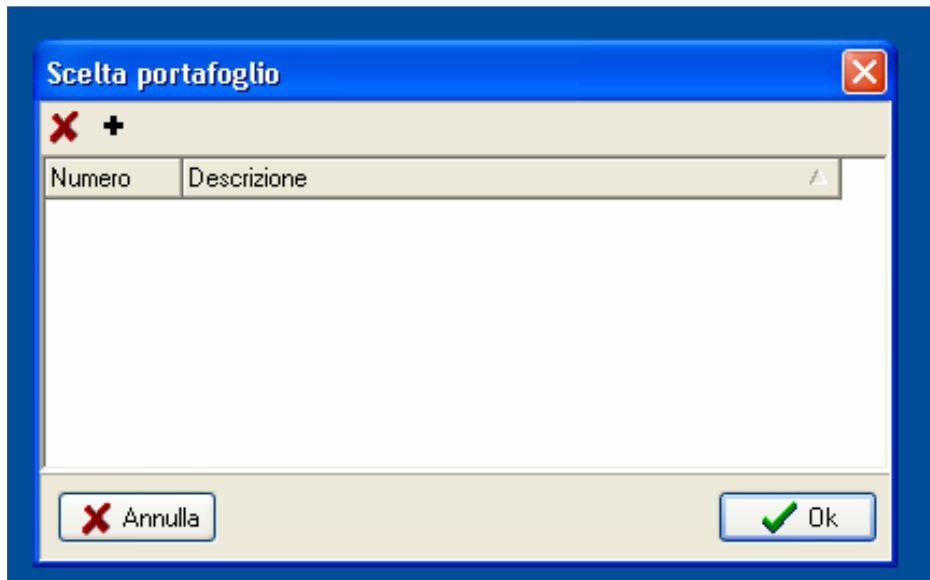

Good CPU Pentium II RAM 64Mb

Optimal CPU Pentium IV RAM 256Mb

Space on HD 40Mb + file data

BEGINNING

At the beginning a folder must be created where to download the data and call it for example (: my market) Launched the software, is requested the formation of a portfolio, that we could call "sp500".

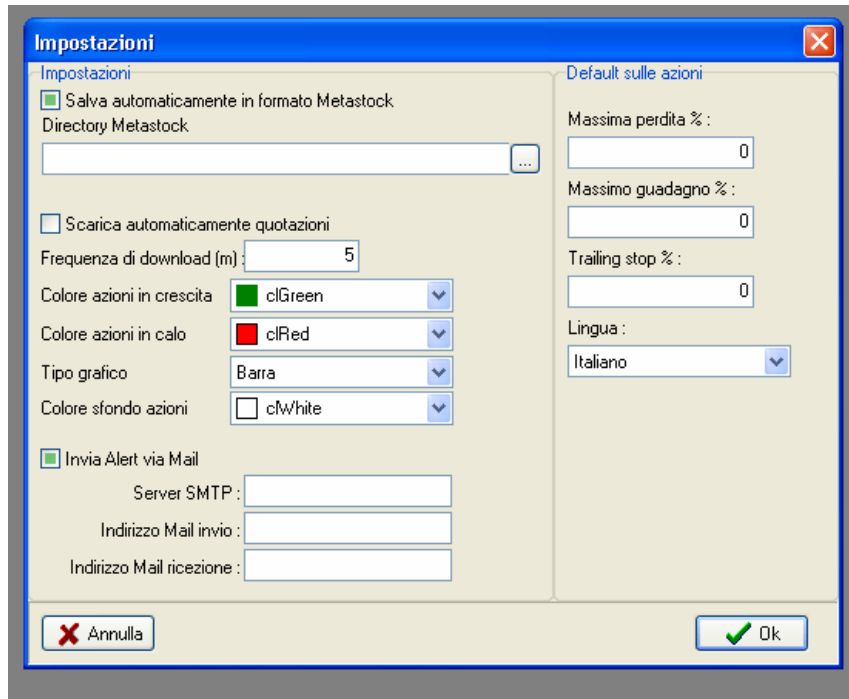

With the sign "+" a portfolio is created, with that one "X" it's eliminated.

OPTIONS

It's possible to personalize the aspect and the characteristics of the software.

1. In the **mask** it is possible to set up:

- the automatic rescue of stocks in a directory that we have predisposed (the "my market" folder cited previously)
- the frequency with which in the course of the day stocks come downloaded actions (1, 5, 10 min. etc....), considering that the data supplied from yahoo are delayed of some minute.

2. The **chart** can be visualized in various ways:

- **Close (line)**: a line joins all close prices.
- **Bar**: it indicates the maximum and minimum of the day and with an external thin line to the bar the opening (line with extension on the left) and the closing (line with extension to right). The various colors will indicate the positive or negative day.

-**Japanese Candles**: extension the data of opening, closing, maximum and every day minimum. The candles are constituted from two parts: the body, consisting in the wider part of the candle (the various colors will indicate the positive or negative closing of the day) and one external thin line to the body. The line indicates the oscillation of the title in the day (maximum and minimal).

-Open/close: similar as visualization to the Japanese candles but indicates only maximum and minimal of the day.

3. The **colors** for the visualization of the software (graphical, background) are personalized.

4. The eventual **alerts** inserted can come notified via email.

5. Within an eventual investment it is possible to set up the following **parameters**:

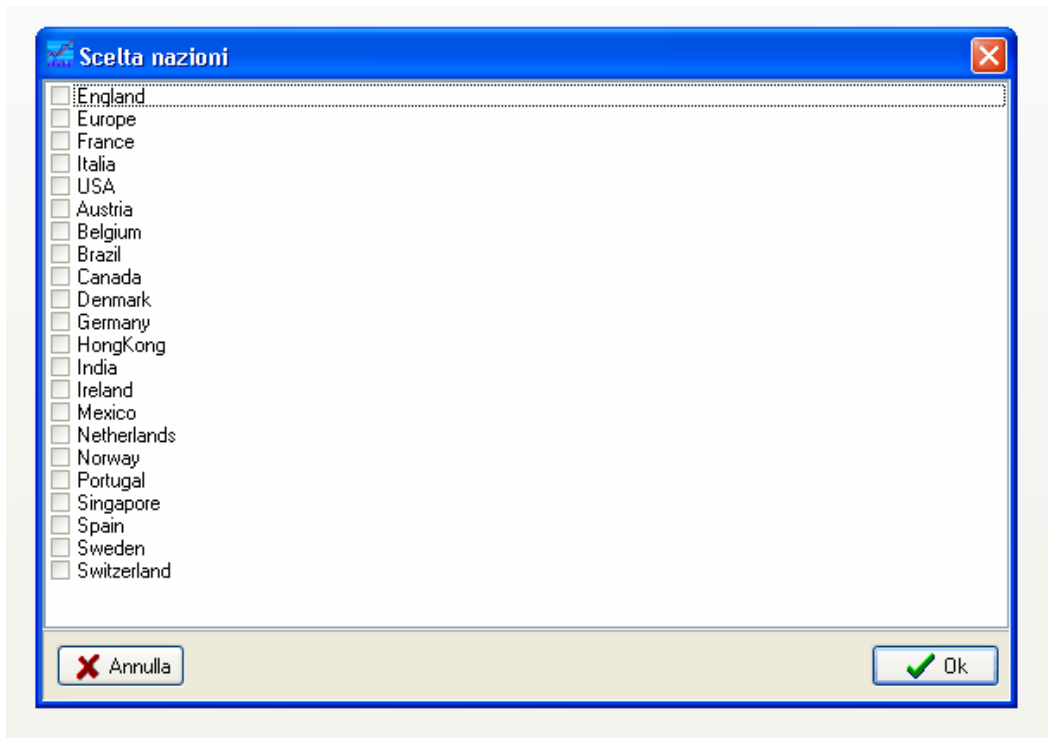

- maximum loss
- maximum gain
- trailing stop*

*Trailing stop: carried out an investment, the program calculates a demotion percentage from the maximums progressively realized and when such value is realized we are informed to. For example: if we buy an stock to 10 euro and arrives to 12 euro, we can place a trailing stop of 2%, in case this retreats from the 12 euro of 2% regarding the value of entrance (10), the alert released.

6. To conclude is possible to choose the **language**.

Made settings, in the bar at the top left choose "Stocks", and then "open complete list"

A mask appears that allows to choose the market that interests us and to select the stocks that we want to follow.

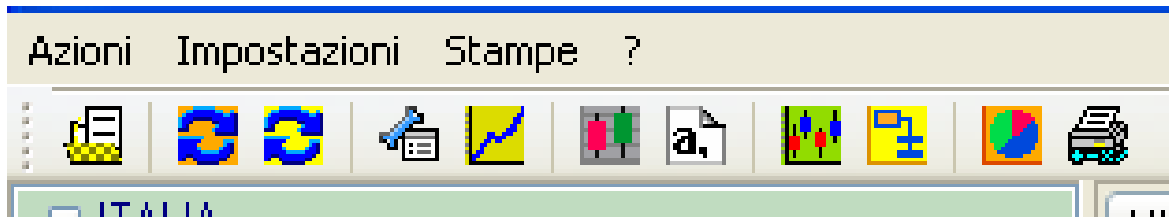

MAIN PAGE

In the main page, it is necessary to note the various possible operations.

Auto download rein attivato

1. At the top on the left there are the different instruments.

From left we find the following symbols:

-  opening of the complete directory of the markets on hand,
-  modernization of the stocks available for every market (the source can vary the organization of the data second new detailed lists, changement of denominations, extension of rows, etc...),
-  download of the stocks, (important: to the action of the download it is better to close all the applications, and not to carry out other operations, since much the system is slowed down and might stop)
-  several options
-  management of the portfolio (possibility to open the other portfolios from created we),
-  export in format metastock,
-  export in other forms (csv o ascii)
-  possibility to open the extended diagram, where inserting several indicators,
-  it visualizes the stocks directory closed from the program,
-  economic management of our portfolio.
-  print

2. In the bottom of the right there is the relative section to the elaboration of data.

Data	Massimo	Minimo	Apertura	Chiusura/Attuale	Volume
07/07/2006	10,45	10,24	10,29	10,412	19535932

- to impose determinated levels of price (alert):

we can define the levels of: price, gain and loss. When these are caught up a mark (alert) is generated. It can be notified via email (see formulations section).

- to determine the split:

Imposta Split

+ X [Save Icon]

Data	Split
11/07/2006	0

What is the split?

Split means the grouping or the subdivision of stocks without altering the value.

Example of:

SUBDIVISION

If an stock is worth 50? , because he becomes more interesting for the small saver , it is decided to carry of the value to 25? subdividing the stock in two parts. The number of the stocks doubles, but the final value does not change. More just the value of the stock has a relationship of 1:2, therefore in order to correct the diagram I will have to multiply the value of the stock for 0.5.

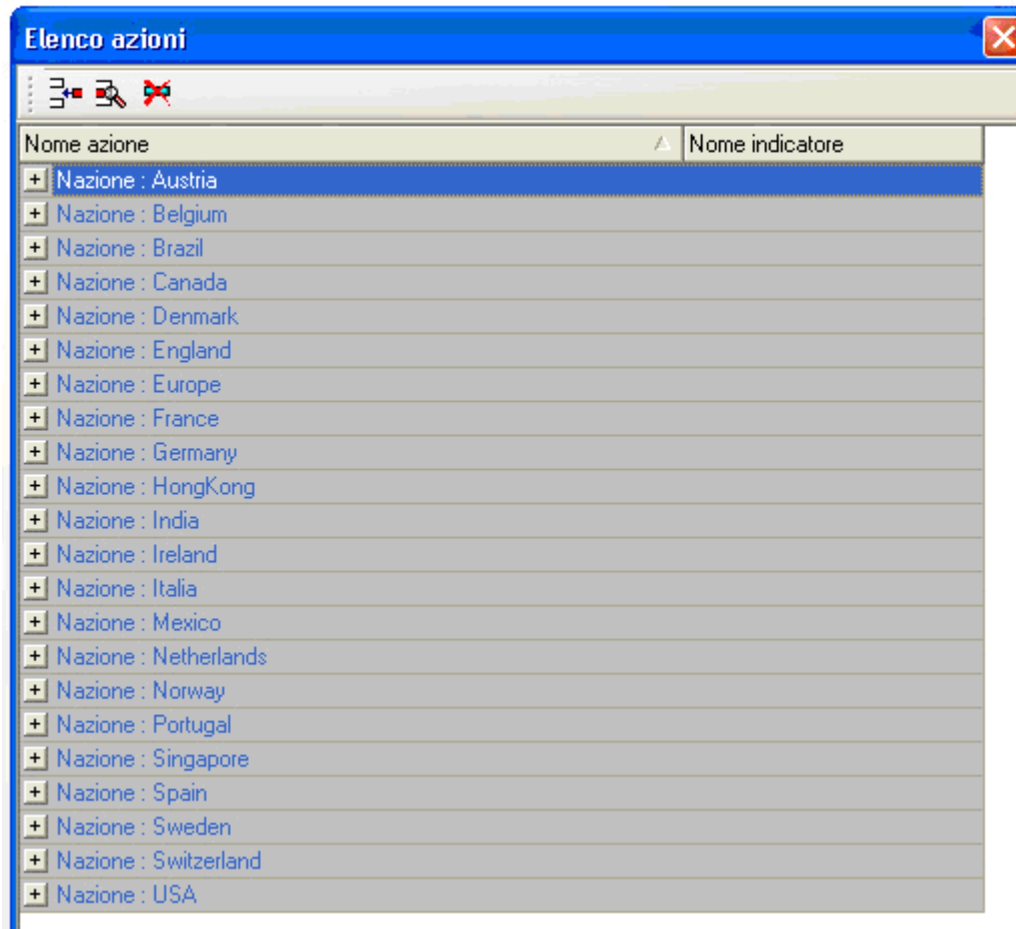

GROUPING

If the value of the stock is inferior to the real value of the company the value through the grouping of 2 or more stocks (2:1 relationship; 3:1.).

With these operations corrected diagrams will be obtained, otherwise could seem that the stock present anomalous oscillations; such correction must be carried out the day of application of the split.

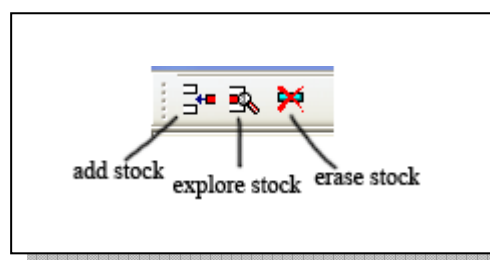

ARCHIVE, STOCKS LIST

The software organizes an archives of the stocks insidly, that are gradually downloaded.

In the archive to historical trace of all the stocks, is kept. If in the several modernizations that the source of the data operates, variations of several list happen , denominations and other, in the archives the old configurations are conserved.

ADD concurs a greater flexibility in the organization of the own ones lists, adding, modifying, cancelling date, according to your requirements.

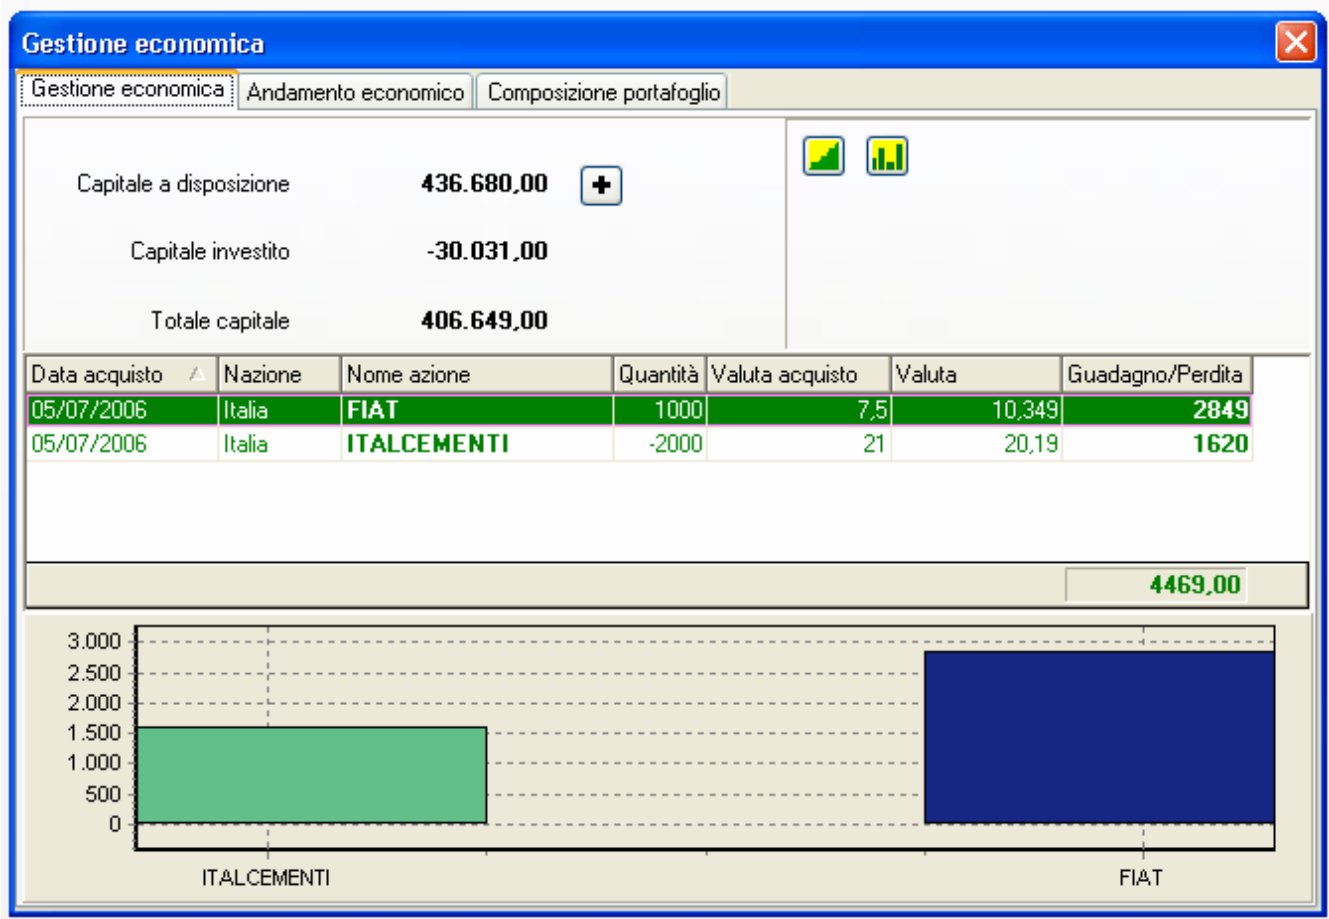

ECONOMIC MANAGEMENT

The software foresees the possibility to manage the own portfolios through:

Economic Management

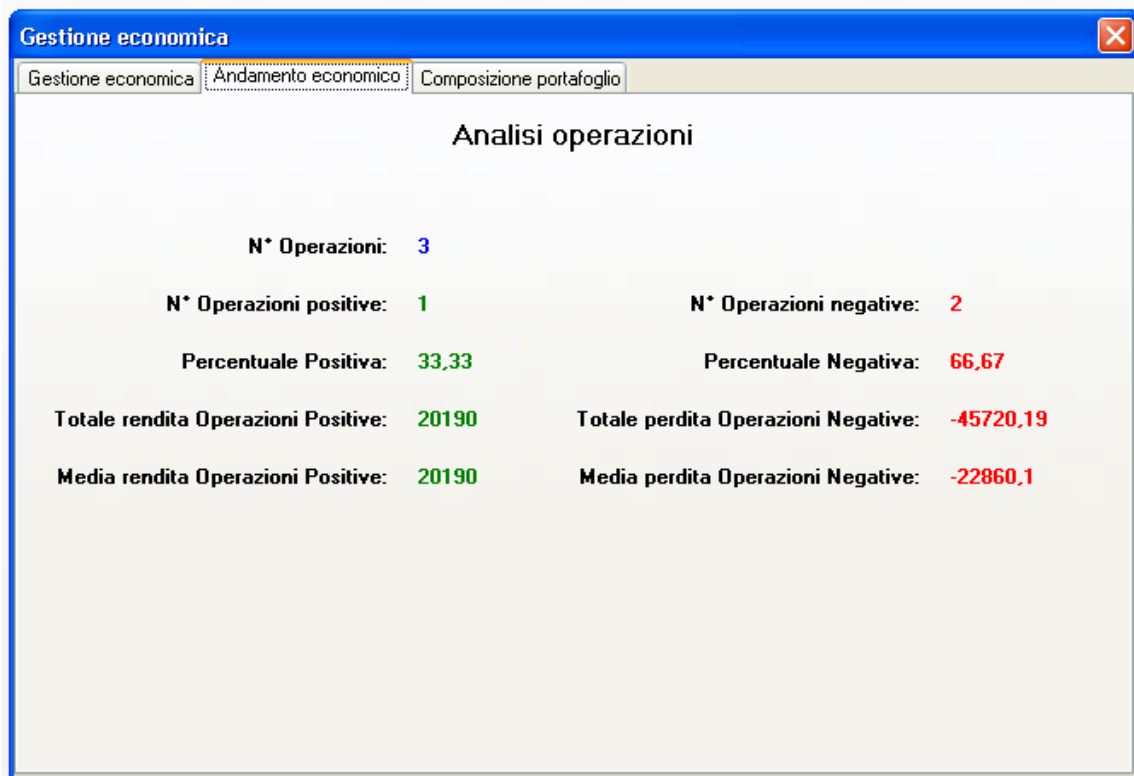

By means of this module it is possible to assume a capital of reference, verifying eventual purchases and sales (simulated or real) monitoring the evolution.

Through the push-button “+” it is possible to determine the capital on hand (adding or removing some) specifying the time terms(the date) from which we wish to begin.

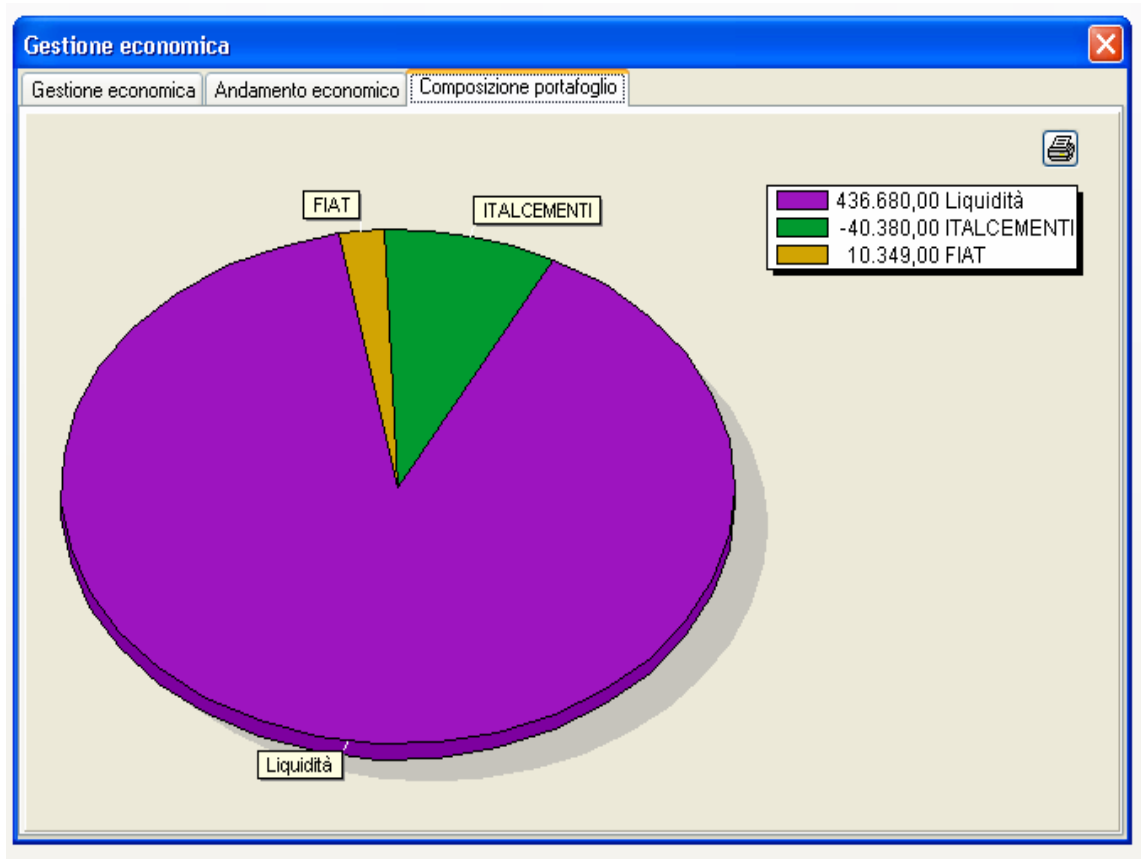

Economic Course

The analysis of the carried out operations verifying of the quality is made.

Composition portfolio: it visualizes the distribution of our capital.

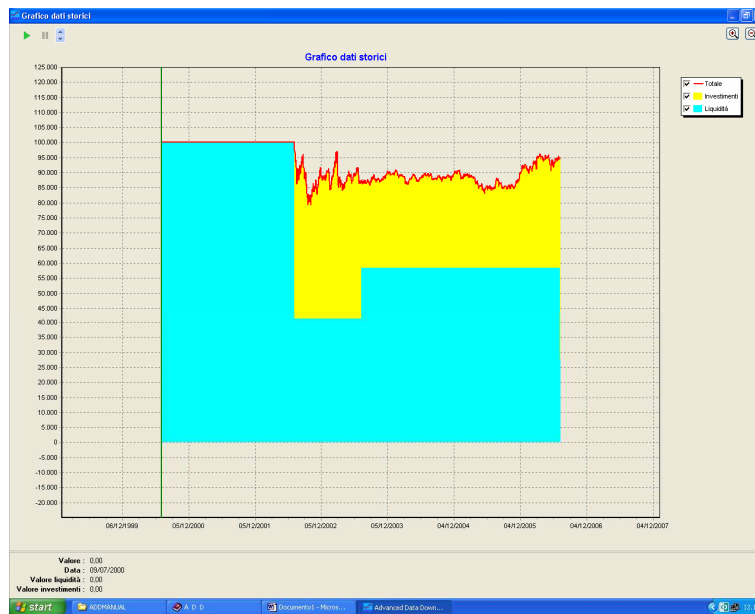

For every stock it is advisable to invest not more of 10% of the capital on their hand and to limit the total loss for a not advanced value to 10% of total (1-2% for every trade, even if it will depend on the volatility of the stock and the timing of the investment).

The **right push-buttons** of the window economic management:

they visualize the course of capital in the time and the diagram of the gain - losses of the portfolio.

OPEN CHART

On the diagram it is possible:

- the complete visualization of the historian
- the application of some among the most known indicators: Macd, RSI, OBV, Stocastico, Bollinger, ADX, Exponential Moving Average,
- the personalisation of parameters and colour according to own preferences,
- the visualization of several the parameters of the stock,
- to save it as an image and to print it.

INDICATOR'S DESCRIPTION

Macd: it's the difference of two exponential averages, usually the periods of the several averages are fixed to 26,12,9 periods.

It indicates the direction of a trend, or better its force.

As operational signals considered either their crossing or the crossing of the histogram regarding to the line of the zero.

Bollinger: The Bands of Bollinger are based on the volatility of a title.

When the bands are near the prices are jammed, when they go away the volatility increases.

Usually the parameters are period = 20, deviation=2.

In case the prices cross the bands, can be a mark them of beginning trend in the undertaken direction, to ring-enter of the prices inside of the bands inverting of the trend is possible.

The bands of Bollinger acquire greater meant if bound together to other indicators, that confirm some marks.

RSI: Relative Strength Index, indicates situations of oversold and overbought.

Like operativity, a possible use is that one to take to positions in purchase in case the RSI from low values (<30) begins to go up again.

On the contrary, we will have a sale mark when from high values (>70) begins to come down.

Usually the period is fixed to 14, however lower values can be set up, having therefore marks timelier (but incurring also false marks).

OBV: The oscillator On Balance Volume (OBV) assigns a positive value to the exchanged volume in case the price goes up, on the contrary negative value in case the price comes down.

Such values come added obtaining the indicator.

ADX: It indicates the force of a trend in existence, two pointers (DMI, DMI-) indicate positive trend or the negative one, the adx of it indicates lasting, correspondent to increasing values.

Stochastic: Oscillator whose use is similar to the RSI.

Exponential Moving Average: Average exponential, dulls the price trend indicating the trend, too. For values of the prices advanced to the curve we have positive trend, for inferior values negative trend.

DEMO VERSION

When the recording mask appears, if it is not in possession of the activation codes, press cancels.

It is approached therefore making the Demo version.

In the Demo version a portfolio of default appears and is possible to download the maximum number of three stocks.

For the recording it is necessary to supply the series number.

Once carried out the payment, the activation code is received.

Completed the recording and obtained the code, its functionality will be complete.

The software may be installed on a PC to the time.

At call it is possible to obtain, without exorbitant price, the maximum number of 3 codes: Installing the software on other PCs, other codes will come demanded, will have to send the numbers of series (various for every PC) and will receive other codes for the maximum number of 3.
